

FERTILITY & POPULATION: A TIMELESS MEASURE OF HUMAN CONDITION

Botan Dolun Tabinda Hayat Xiao Hu Ashwini Shivaji Meher

DID YOU KNOW?

On November 15, 2022, the world population reached a milestone— 8 billion!

Definitions

- Fertility is “the ability of an individual or couple to reproduce.”
- Fertility Rate is “the average number of children born to women during their reproductive years.”

SOURCE: Britannica

Fertility Rate \neq Birth Rate (Natality)

Definitions

- Mortality is “the frequency of death in a population.”
- Suicide Mortality Rate is “Number of suicide deaths in a year, divided by the population and multiplied by 100 000.”

SOURCE: WHO

Definitions

- Life Expectancy is “the estimate of the average number of years that a person of a given age can expect to live.”

SOURCE: Britannica

- In 1950s, a family had **5** children on average, today a family has less than **3** children on average.

- Some reasons for the decrease in fertility rates:

- Women's empowerment, both in education and workplace
- Lower child mortality
- Increased cost of raising a child

Fun fact 🤔
The country
with the lowest
fertility rate in
2022 is South
Korea - 0.9

SOURCE: World Economic Forum

According to the World Economic Forum (WEF), partly due to these reasons, the global fertility rate has decreased dramatically in the last 70 years by around 50%.

QUESTION: If fertility rate is declining, then why is the world population still increasing?

Dataset overview

The world bank population international dataset provides estimates of country populations since 1950 and projections through 2020.

Specifically, the dataset includes midyear population figures and `population_growth_rate`. Additionally, time-series data is provided for attributes including fertility rates, `life_expectancy`, `fertility_rate` etc.

Population growth rate

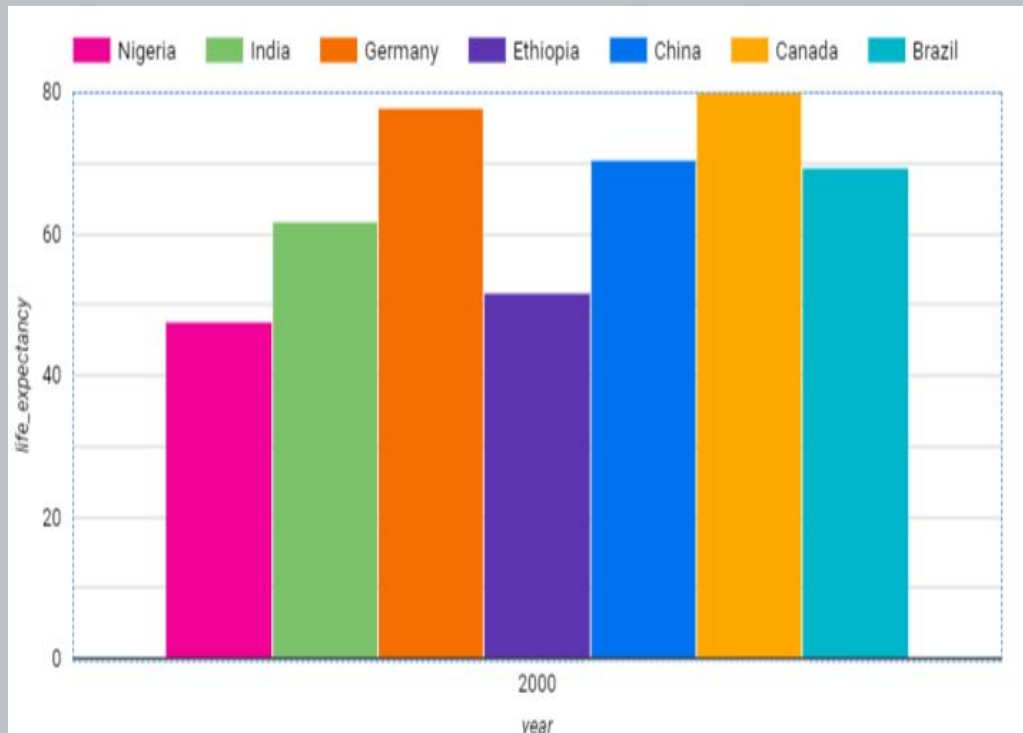

2000

2019

Life expectancy rate

2000

2019

Unemployment female rate

2000

2019

Women In Labor Force

2000

2019

Fertility rate

2000

2019

Suicide mortality rate

2000

2019

CONCLUSION

The reason for the increase in population despite the decreasing fertility rate is that the average fertility rate is 2.76 (2000-2020) and 3.37 (1950-2020), which are higher than **2.1** — the value over which the population would increase (WEF).

The report finds that by 2050, global fertility is expected to be **2.2 births per woman**, down from 2.5 today. This rate is inching closer to the replacement rate of 2.1—the number of births per woman needed to maintain a population's size (IMF).

CONCLUSION

According to the United Nations, Africa will likely account for “more than half of the world’s population growth between 2015 and 2050. Its population is projected to double by 2050, and could double again by 2100”.

CONCLUSION

“The biggest things are the modern tools of contraception,”

“If you have those things available then people have more control over being able to space their children.”

“To continue improving the human condition, our task now is to help create opportunities in Africa’s fastest-growing, poorest countries,”

“This means investing in young people.”
